

A Large Kentucky Steel Manufacturer with 1500 Employees Implements New Procedures to Safeguard its Employees

A large Kentucky steel manufacturer faced the challenge of having its vitally important employees show up each day while eliminating possible infection of the entire workforce. Their stated goals were as follows:

Adhere to FDA issued guidelines pertaining to fever screening technology

Speed the process of screening several hundred employees and contractors at each plant entrance

Accuracy, repeatability and simplicity of the instrumentation

Solution:

Schlemmer Associates was contracted to program and install several camera systems at the facility entrances, where employees and visitors are now required to report. The solution was quickly deployed by Schlemmer Associates service team, who also provided the system training to company administrators.

The result has been highly successful. On average, two to three people per shift are referred to the on-site staff medical professional for further testing.
